Discussion Focus:

1. What/where is the science on basing dietary recommendations on chronic disease endpoints?
   
   A. For basing DRIs on chronic disease endpoints.

   B. Is the science stronger for prevention of chronic disease or amelioration of disease after it has already occurred?

   C. Is the science stronger for basing DRIs or food recommendations on chronic disease endpoints (e.g. omega 3 fatty acids vs fish intake)?

   D. Where do we stand on considering chronic disease endpoints as useful markers for diet recommendations (based on experience re to recent AJCN committee report)?

2. What is the connection between DRIs and DGA? Could this relationship be strengthened? If so how?
